

Apparatus and method for displaying advertisements on golf courses and golf centers

Abstract

This invention relates to an improved golf ball holder system. The invention is used for displaying advertisements while holding golf balls. The unit is placed on a golf course or golf center including but not limited to where the golfers warm-up or practice. The unit serves a dual purpose in holding the golf balls and as a venue for advertisements to be viewed by the golfer. The unit has a section that holds golf balls along with spaces for advertisements to be displayed on the surface of the unit. The unit has indentations in the surface to enable a person to be able to change the advertising signs/plaques easily. Also, the unit has a curved slope that allows the golf balls to be easily extracted from the ball holder. The unit's face is slanted at an angle so that the advertisements can be viewed easily by the golfer.
